PROFILE

Software Engineer with 2+ years of experience modernizing business-critical banking systems, migrating legacy CoolGen and monolithic platforms to Java/Spring Boot microservices for capital markets and individual pension systems. Skilled in event-driven architecture (Kafka, RabbitMQ), gRPC, and React, with direct experience delivering transaction-critical workflows in regulated financial environments.

SKILLS

Languages & Frameworks: Java, Spring Boot, React, SQL

Backend & Integration: Microservices, REST APIs, gRPC, Apache Kafka, RabbitMQ, Redis, Batch Processing

Databases & Tools: Oracle, Docker, Git, Maven, PowerDesigner, GitHub Copilot, Claude Code

Architecture & Practices: OOP, SOLID, Design Patterns, Unit Testing (JUnit), Agile/Scrum

EXPERIENCE

Software Engineer — Garanti BBVA Technology via Linktera

Remote, Full-time | October 2025 – Present

- Contribute to the modernization of Individual Pension Systems, migrating legacy CoolGen-based applications to microservices using Java, Spring Boot, Kafka, gRPC, React, and Oracle.
- Develop modern React-based interfaces to replace legacy screens, including workflows for individual pension exit operations.
- Applied AI-assisted development with a focus on model selection, context management, and token efficiency, using capable models for complex tasks and lightweight models for simpler tasks.
- Implement backend processes for pension exit workflows, including automated email, SMS, and document delivery following transaction completion.
- Participate in high-level and low-level system design, including service design, data modeling, and database schema design using PowerDesigner.

Software Engineer — Yapı Kredi Technology via Metasis Technology

Remote, Full-time | June 2024 – October 2025

- Engineered the migration of capital markets and investment systems from legacy applications to microservices using Java, Spring Boot, Kafka, RabbitMQ, Redis, React, and Oracle.
- Delivered core workflows for the microservices transformation of the IPO platform, covering IPO management, allocation, and payment processing, including batch jobs, file generation and transfers, notifications, and integrations with core banking and provisioning systems.
- Built a corporate actions notification workflow for international equities, processing brokerage documents, matching events with customer portfolios, and delivering personalized email and SMS notifications for events such as dividend payments.
- Integrated document-based capital markets operations with the bank's workflow management platform, enabling branch-initiated and standalone transaction flows through microservices-based services.
- Maintained project-level code coverage requirements of at least 80% by developing unit tests for backend services and business workflows.

Software Developer Intern — Eczacıbaşı Bilişim

Remote, Internship | March 2024 – May 2024

- Performed functional testing and reported software defects to support quality assurance processes.

Java Developer Intern — E-Commint

Remote, Internship | August 2023 – October 2023

- Contributed to the development of e-commerce applications using Java and Spring Boot.

PROJECTS

IPO Platform Modernization – Yapı Kredi Technology — Contributed end-to-end to the modernization of a legacy stock IPO platform into a Java and Spring Boot-based microservices architecture, covering IPO definition and listing, allocation management, provisioning and payment services, and integrations with surrounding banking systems. Used Java, Spring Boot, React, and Oracle.

Individual Pension System – Retirement Exit Module Modernization – Garanti BBVA Technology — Contributed end-to-end to the modernization of the retirement exit module of an individual pension system. Applied Strategy, Factory, and Template Method design patterns to support document generation that varies by transaction type. Actively leveraged AI-assisted development using GitHub Copilot and Claude Digital Worker. Used Java, Spring Boot, React, and Oracle.

Morning Wire – Spec-Driven, AI-Assisted Personal Project — Built a Python pipeline that delivers a daily personalized briefing over plain SMS to a phone with no internet access, covering markets, portfolio, news, sports, and language study. Deployed entirely on GitHub Actions with no server, using a webhook-driven Android relay. Used Python, GitHub Actions, and Claude API.

Eye Disease Classification from Fundus Images – Graduation Thesis — Developed a deep learning-based system for classifying eye diseases from fundus images using VGG16 and ResNet50, with Grad-CAM for visual explainability. Awarded 1st place among graduation projects in the Computer Engineering Department.

Kutla! – AI-Assisted Mobile Application (Personal Project) — Mobile application using an AI agent-driven development workflow that generates personalized celebration visuals for holidays and special occasions by orchestrating requests to image generation models.

EDUCATION

Eskişehir Technical University — B.Sc. in Computer Engineering, English | Eskişehir, Türkiye | Sep. 2019 – Jun. 2024
